

PECULIARITIES OF SPECIFIC VACCINATION, UTILIZING HOUSE DUST MITE ALLERGENS UNDER AKAROLOGIC MONITORING OF THE HOUSES

S.N. NEDELSKA, J.V. KOTLOVA

Summary

A sensitization of respiratory tract to house dust mite allergens is well-recognized cause of bronchial hyperresponsiveness (45–86 %). The effectiveness of specific vaccination, utilizing house dust mite allergens, was analyzed in 327 children under the conditions of specific elimination measures at the houses. The specific elimination measures decreased the house dust mite contamination and raised the effectiveness of specific vaccination.
