

FEATURES OF ASTHMA CLINICAL COURSE AT OVERWEIGHTING PATIENTS

T. O. Pertseva, N. P. Nud'ga

Summary

For investigation features of asthma clinical course in overweighting subject there were examined 106 asthma patients with III and IV steps of disease. According to study results patients with obesity had a worse asthma control with higher number of day time symptoms and short-acting beta2-agonist use, more expressed subjective sensation of dyspnoe, which limit daily activity in comparison with patients with normal body weight. According to the one-factorial dispersive analysis, the high body weight had significant influences on asthma control and daily activity.
