

PHARMACOECONOMICAL ASPECTS OF USING OF ANTIANXIOUS AND NOOTROPIC PREPARATIONS IN COMPLEX TREATMENT OF PATIENTS WITH BRONCHIAL ASTHMA WITH CONCOMITANT SOMATOPSYCHICAL DISFUNCTION

Konstantinovich T. V.

Summery

The results of own researches are represented in the article, based on the pharmacoeconomical analysis of application of antianxious preparation afobasol (A) and nootropic preparation tiocetam (T) in complex treatment of patients with bronchial asthma (BA) with the diagnosed somatopsychical disfunction (SPD). The research group was made by 29 BA patients, which got preparations of base therapy (BT) in combination with A and a 21 patient, which got base therapy in combination with T. T control group was made by 28 patients OH, getting only preparations of base therapy. Clinical-functional efficacy of researched groups made 62,1 % for A and 28,6 % for T, control groups – 14,4 %. Cost of treatment of BA patients BA the A-use was characterized by the optimum index «cost-efficiency», which made 1,87. The program of complex therapy with including of A in 2,2 times is cheaper and more economical by comparison to the program of treatment with including of T.
