**Abstract.** Vascular abnormalities in children often cause diagnostic difficulties for doctors of all specialties, as the skin syndrome unites a very large number of skin lesions inherent in many infectious, rheumatological or surgical pathologies. This article describes the features of skin lesions in some rheumatological diseases and vascular anomalies, as well as a clinical case of an atypical clinical picture of a vascular malformation, which led to diagnostic difficulties and the postponement of adequate therapy.

**Key words:** children, hemorrhagic rash, vascular malformations.
