Summary. The results of the study confirmed high clinical efficacy of amoxicillin (500 mg t.i.d.) in treatment of patients with mild community-acquired pneumonia (1st category). The therapy with HICONCIL (KRKA, Slovenia) in comparison with FLEMOXIN SOLUTAB (Yamanouchi Europe, The Netherlands) had the advantages because of lower costs of treatment.

Key words: *community-acquired pneumonia, anti-bacterial therapy, amoxicillin.*
