Summary. Materials of compared description of hemodynamic effects of Hekodez (manufactured by “Yurija-Farm” Ltd, Ukraine) and Refortan (“Berlin-Chemie”, Germany) in complex of intensive care of hypovolemic nonhemorrhagic shock connected with dehydration and acute surgical pathology were presented. It was shown that using of Hekodez or Refortan in complex of infusion therapy of hypovolemic nonhemorrhagic shock formed hyperdynamic type of circulation and provided hemodynamical stability during 6–12 hours after infusion.

Key words: *nonhemorrhagic hypovolemic shock, central hemodynamics, Hekodez, Refortan.*
