

THE SYNDROME OF SYSTEMATIC PHLOGISTIC RESPONSE IN MAIEUTICS, PATHOGENETIC APPROACHES TO DIAGNOSIS AND CURING

V. Lebeduk, G. Marinoha, Y. Pleten

Summary. The main goal of research was investigation of the most efficient diagnosis criterions and improvement of a curing tactic for phlogistic sicknesses in maieutics. 18 patients of maieutics reanimation division were examined with the biomarker of phlogistic – procalcitonin with the further curing by the domestic solution Latren, which improves microcirculation and reological features of blood, normalize electrolytes and have antimedical properties because of pentoxifylline.

It was discovered that the most positive results in curing phlogistic sicknesses in maieutics were achieved with the complex solution Latren implementation, this was proved by the procalcitonins indices – which is the best diagnosis parameter of phlogistic processes.

Key words: *the syndrome of systematic phlogistic response, procalcitonin, pentoxifylline, latren.*
