

CONCEPTUAL-INNOVATION TRANSFORMATION OF PERIOPERATIONS INFUSION-TRANSFUSION THERAPY

K. Serikov

Summary. The results of infusion-transfusion therapy and anesthesiological maintenance of 227 patients, which were operated concerning a gastrointestinal bleeding of a ulcerative genesis are generalized. The usage of suggested tactics of infusion-transfusion therapy was allowed to remove reliably infringements of parameters of biological fastness of an organism, to reduce lethality and to introduce effective blood-saving.

Key words: *gastrointestinal bleeding, status-measuring, integrative blood-saving therapy, intense volume of a blood, anesthesiological maintenance.*
