D.O. Kurbanov***

Summary. The endogenic toxication level and rheological disturbances of blood were assessed in 35 patients with acute destructive pancreatitis.

The infusion therapy of 12 patients consisted of Rheosorbilact in dose 400 ml once daily during 10 days. The rest 23 patients were treated using conventional medications infusions.

The results demonstrated that Rheosorbilact was more effective in terms of reduction of the endogenic toxication and improvement of blood rheology.

Key words: *acute destructive pancreatitis, infusion therapy, rheosorbilact.*
