Summary. Besides the standard report of an intensive care, patients with a serious craniocerebral trauma require timely carrying out of an incomplete parenteral food. Application of amino-acid solutions Aminosol or Aminosol KE promotes optimum satisfaction of requirement of an organism in proteins at patients with serious craniocerebral trauma in a hypermetabolism, reduces expression of clinical implications of a catabolic syndrome, promotes improvement of a current of disease. The analysis of data of an acid-base condition, the central hemodynamic, indexes of transport of oxygen has confirmed safety of carrying out of an early incomplete parenteral food with including of amino-acid solutions Aminosol or Aminosol KE, the patient with craniocerebral trauma in the acute period of disease.

Key words: an incomplete parenteral nutrition, aminosol.
