**Summary.** The aim of the study was to determine the clinical effectiveness Tivortin infusion therapy in the treatment of pyelonephritis during pregnancy. Were examined 120 patients with gestational pyelonephritis or exacerbation of chronic pyelonephritis, which have evolved in their gestation 13-17 weeks. I-group consisted of 70 individuals who received the conventional treatment, II formed a group of 50 women who received additional Tivortin.

Tivortin use in treatment of pregnant patients with pyelonephritis leads to an improvement of hemoperfusion in the kidneys, reducing intraorganic hypoxia as one of the pathogenic mechanisms of infection and inflammation, accelerate the positive dynamics of clinical and laboratory signs of pyelonephritis, further reduction in the incidence of complications in pregnancy and recurrent infectious and inflammatory process and asymptomatic bacteriuria.

**Keywords:** *pyelonephritis, pregnancy, Tivortin, complications of pregnancy.*
