

FEATURES OF PERIOPERATIVE INFUSION THERAPY DURING RESECTION OF LIVER IN CANCER SURGERY

E. A. Kolganova

Summary. The technique of infusion-transfusion therapy, including preoperative normovolemic hemodilution and the use of autologous blood during liver resections. Studied during the perioperative period, the dynamics of blood flow parameters, laboratory data in 90 patients. Found that the proposed scheme provides infusion therapy hemodynamic stability and reduces the amount of transfused blood products.

Keywords: *oncosurgery, liver resection, infusion therapy, normovolemic hemodilution, autologous blood.*
