

SOME EPIDEMIOLOGICAL AND CLINICAL PECULIARITIES OF RESPIRATORY TUBERCULOSIS COMBINED WITH URINARY TRACT TUBERCULOSIS

T. V. Lutsishin

Summary

The 60 case histories of patients with respiratory tuberculosis combined with urinary tract tuberculosis were analyzed. It was established that in 70 % of cases inactive lesions in respiratory system were combined with active process in urinary tract. The most characteristic manifestations of active pulmonary tuberculosis were cavitations and fibrosis. In 91,6 % of patients active pulmonary tuberculosis was accompanied by active kidneys involvement. Active tuberculosis of kidneys parenchyma was twice less common in inactive pulmonary tuberculosis cases.
