

# LOMEFLOXACIN (LOMADEY) IN TREATMENT OF COMMUNITY-ACQUIRED PNEUMONIA PATIENTS

***S. A. Suprun, S. I. Latogus***

## *Summary*

As a result of comparative study of efficacy and tolerability of lomefloxacin (Lomadey) and amoxicillin/clavulanic acid in patients with community-acquired pneumonia, there have been established that Lomadey was effective and safe agent in empiric therapy of community-acquired pneumonia. The indications for administration of Lomadey are as follows: infections, caused by a majority of obligate or facultative aerobic gram-negative microorganisms, fascidia, atypical pathogens and less frequently — gram-positive microorganisms. Oral treatment with Lomadey is appropriate and highly effective in most patients and does not require significant financial spending.
