

# THE MANAGEMENT OF CHRONIC OBSTRUCTIVE PULMONARY DISEASE OF I–II STAGE USING ANTIHOMOTOXIC PREPARATIONS

*I. P. Kaidashev, D. M. Boyko, V. V. Gorbatenko*

## *Summary*

We conducted a comparative analysis of efficiency of antihomotoxic preparations — Grippe-Nosode-Injeel and Lymphomyosot, administered on the background of the basis therapy, of patients with chronic obstructive pulmonary disease of I-II stage, using clinical and immunological parameters. Application of antihomotoxic preparations — Grippe-Nosode-Injeel and Lymphomyosot — led to increase of immunoglobulin A and G levels and more dynamical regress of clinical indices. The combination of antihomotoxic preparations — Grippe-Nosode-Injeel and Lymphomyosot — with basic therapy increases the efficiency of the treatment.
