

INFLUENCE OF SYNGLET-OXYGEN THERAPY ON CLINICAL-FUNCTIONAL PARAMETERS IN PATIENTS WITH COPD

L. M. Kuryk

Summary

We have studied the influence of singlet-oxygen therapy (SOT) on clinical and functional parameters of patients with COPD.

The results of the study confirmed, that the SOT had significant therapeutic effect, which consisted in improvement of clinical symptoms, less frequent use of shortacting bronchodilators and improvement of physical parameters of exhaled air condensate and lung function parameters.

The data obtained support the recommendation of an application of SOT in complex treatment of patients with COPD.
