

PECULIARITIES OF COURSE AND RESULTS OF TREATMENT OF TUBERCULOSIS IN PREGNANT AND RECENTLY CONFINED WOMEN

M. M. Savula, M. I. Sachelashvili, Yu. I. Slyvka

Summary

Follow-up of 137 pregnant and recently confined women demonstrated that during a pregnancy the tuberculosis was often asymptomatic and in 36,6 % of cases was diagnosed in obstetrics department. In patients, which got ill after the labor there was higher prevalence of destructive forms of tuberculosis. Progression of active tuberculosis was associated with pregnancy and more rarely the relapses were observed in patients, which didn't receive proper treatment or prophylaxis. The results of treatment were good in newly diagnosed cases. In relapses less than a half of patients have recovered. The concomitant diseases, drug and alcohol abuse worsened the results of treatment.
