

PECULIARITIES OF CLINICAL COURSE AND TREATMENT OF PULMONARY TUBERCULOSIS IN PREGNANT AND WOMEN OF REPRODUCTIVE AGE

G. V. Sadomova

Summary

In open randomized controlled study the current author has revealed the peculiarities of newly diagnosed pulmonary tuberculosis in 204 women of reproductive age and in 54 pregnant women. It was established that the course of the disease in this group of patients had its own clinical, radiological and bacteriological features. Timely initiated therapy, smoking cessation, short-term management of bronchial obstruction and belief in recovery allowed increasing the effectiveness of treatment under the constant chemotherapy regimens.
