

# THE PATHOMORPHISM OF BRONCHIAL LESIONS IN PATIENTS WITH LUNG TUBERCULOSIS

*I. O. Novozhilova*

## *Summary*

The results of examination of 3990 patients (30033 — in 2003 and 957 — in 1993) with tuberculosis and other lung diseases were studied in order to reveal any peculiarities of lung lesions in conditions of current tuberculosis epidemic.

It was demonstrated that the typical bronchological lesions, revealed during epidemic were more extensive and had some distinctive features in comparison with those in pre-epidemic period.
