

# PERSPECTIVES OF ELECTROACUPUNCTURE DIAGNOSTICS FOR DETERMINATION OF PLEURAL EFFUSION ETHIOLOGY

*N. S. Opanasenko*

## *Summary*

In order to evaluate differential diagnostics criteria we studied the range of physiological activity and energetic level for 12 classic meridians in 113 patients with pleural effusion of tuberculosis, neoplasm, non-specific and cardiac etiology. All diagnoses were confirmed by histology methods. It was proved that the most informative criteria for diagnosis of pleural effusions of different etiology using Riodoraku method were physiological normal range and energetic levels for meridians of lung, heart and pericardium.
