

# QUALITY OF LIFE OF PATIENTS WITH BRONCHIAL ASTHMA IN DIFFERENT PERIODS OF THE DISEASE

***S. G. Donich***

## *Summary*

Quality of life (QL) of patients with bronchial asthma (BA) is determined by the period of disease course. During the exacerbation all QL parameters decrease substantially, while in remission phase the values correspond to and even exceed average population levels. In disease exacerbation QL is formed by considerably bigger number of factors. The leading determining factors are the parameters of patient's current status (asthma control score, severity of disease, functional indices). In phase of remission these are the patient's constitution indices, disease course and treatment parameters.
