

PULMONARY BLEEDING

L. V. Luzan

Summary

Pulmonary bleeding syndrome remains one of the most common and most dangerous complication with unforeseen causes, duration and outcomes in more than 100 diseases. Bronchoscopy is the most valuable method of pulmonary bleeding diagnosing, allowing to determine localization of bleeding, assess the causative condition and the intensity of bleeding. In certain cases it helps to stop bleeding temporary until surgery becomes possible. These statements were confirmed by the results of analysis of 196 cases of pulmonary bleeding in patients, admitted to Chernihiv oblast tuberculosis dispensary during 2005–2008 yy.
