

CLARITHROMYCIN IN MODERN THERAPY OF ALLERGIC CONDITIONS

O. M. Gyrina, P. V. Grishylo, L. D. Vityk

Summary

We analyzed the results of treatment using clarithromycin (Fromilid® Uno, KRKA) of 164 patients with asthma (108 patients), atopic dermatitis (16 patients), allergic rhinitis (16 patients) and urticaria (28 patients). The patients took medicine during 10-14 days on the background pathogenesis therapy. It was proved that the therapy shortened the time to clinical remission, caused no serious adverse reactions (those registered adverse reactions were mostly mild and did not require discontinuation of drug). The regime of treatment using Fromilid®Uno may successfully be used for therapy of patients with asthma, atopic dermatitis, urticaria and complicated allergic rhinitis.
