Summary

The role of the viruses in the etiology of community-acquired pneumonia has been studied. Viral pathogens were revealed in 28,6 % of patients with community-acquired pneumonia. Influenza A virus (15,6 %), respiratory coronavirus (11 %), adenovirus (1,3 %), RS-virus (0,7 %) were more prevalent. In 18,6 % of cases we observed combination of bacterial and viral pathogens (coronavirus — in 10 % of cases). Among isolated bacterial pathogens *S. pneumoniae* dominated.
