

BCG VACCINATION: STATE OF ART AND PERSPECTIVES

V. P. Melnyk, L. V. Gutynska, A. V. Sadomova-Andrianova, T. G. Hursa, A. A. Petrenko, L. V. Krasikova

Summary

The article presents current data on tuberculosis vaccination and revaccination. It have been demonstrated that during 1974-2009 years the frequency and effectiveness of BCG vaccination was sufficient in Kyiv city. The first booster vaccination (at the age of 7 years) during 1981–2005 was insufficient (14,3–23,5%). Since 2006 — prevalence of this immunization has decreased by 6 times. The second booster with its prevalence of 1,6–10,7%, since 1988 up till present day, appeared to be unjustified.
