Summary

The results of the study, conducted in order to establish the differential diagnosis criteria of bronchial obstructive syndrome in children, have been presented in the article. It was demonstrated that manifestations of obstructive syndrome depended on the age of a child and they were similar in children of preschool age. The risk factors for asthma such as antenatal and intranatal complications, hereditary allergic diseases, and atopic syndrome have been revealed. At the same time there have not been revealed the link between the occurrence of asthma and passive smoking, adverse living conditions, the age at which child first developed the illness.
