

PECULIARITIES OF CLINICAL COURSE OF BRONCHIAL ASTHMA

A. I. Bezrodnaja, E. M. Hodosh, P. I. Potejko

Summary

The early or late debut of a bronchial asthma in parents correlates with the course of disease in posterity. There is an effect of anticipation in descendants the illness begins at earlier age, than in parent. We calculated Pearson's correlation coefficient which for parent-descendant pairs was 0,54 ($p < 0,001$). The variation of correlation coefficients was typical and depended on age of the patients.
