

PULMONARY HYPOPLASIA: A CASE REPORT

I. V. Gavrysiuk, V. M. Rudnichenko, M. A. Kushnerova

Abstract

Pulmonary hypoplasia belongs to a group of congenital defects, leading to the lesions of organ anatomy, structure and tissue elements. Pulmonary hypoplasia is one of the most prevalent lung congenital anomalies, but in comparison with other lung diseases it is quite rare. Considering this fact the diagnosis of pulmonary hypoplasia is challenging for a practicing physician or pulmonologist.

Current case report illustrates a typical clinical and radiological presentation of pulmonary hypoplasia.

Key words: pulmonary hypoplasia, clinical presentation, radiological findings.

Ukr. Pulmonol. J. 2014; 1: 65–68.
