

BRONCHOPULMONARY DYSPLASIA IN THE EARLY AGE (CASE REPORT)

E. V. Kens, O. I. Mysak

Abstract

Brohopulmonary dysplasia is a variant of chronic pulmonary disease. Increase of survival index of newborns with very low birth weight leads to an increase in the incidence of bronchopulmonary dysplasia, which in turn increases the mortality rate of children. The article presents a case of severe bronchopulmonary dysplasia associated with the development of pulmonary hypertension, contains clinical, diagnostic data and demonstrates the difficulties in carrying out conservative therapy.

Key words: bronchopulmonary dysplasia, clinical manifestations, diagnostic techniques, conservative therapy.
